```
A new method is provided for the synthesis of oligonucleotides having (N3'->P5' phosphoramidate linkages. The method comprises (a) attaching a 3'-protected antino nucleoside to a solid support; (b) deprotecting the 3'-amino; (c) reacting with a 3'-protected aminouncleoside-5'-phosphoramidite link; (d) oxidising this link to phosphoramidate; and phosphoramidate link; (d) oxidising this link to phosphoramidate; and optionally repeating steps (b)-(d) until the required oligonucleotide of is completed. This method provides better yields with lower reagent consumption than known processes, and can be operated on a large scale. The obtained oligos, containing phosphoramidate linkages, have favourable binding properties, nuclease resistance and solubility, and are useful as research, diagnostic and therapeutic agents. The present sequence is an example of an oligonucleotide in which N3'->PS' (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                    a

The method comprises (a) attaching a 3'-protected amino nucleoside to a solid support; (b) deprotecting the phosphoramidite manomer to form an internucleoside N3'-> p5' phosphoramidite monomer to form an internucleoside N3'-> p5' phosphoramidite link; (d) oxidising this link to phosphoramidate; and optionally repeating steps (b) (d) until the required oligonucleotide is completed. This method provides better yields with lower reagent consumption than known processes, and can be operated on a large favourable binding properties, nuclease resistance and solubility, and are useful as research, diagnostic and therapeutic agents. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence is an example of an oligonucleotide in which N3'->P5' phosphoramidate linkages have been introduced by the new method. (Updated on 25-WAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Shaler TA;

Pollart DJ,

The sequence is that of an oligonucleotide primer which was produced as part of an oligonucleotide peptide conjugate as an example of a part of an oligonucleotide peptide conjugate as an example of a release tag compound (RTC). These comprise a reactive group, a release tag compound (RTC). These comprise a reactive group, a release tag compound (RTC). These comprisend a specific or a reactive group, a synthetic polymer or biopolymer detectable by mass spectrometry. They can be used for e.g. identification of fine. Sequences, identification of non-coding nucleotide sequences, identification of metals, identification of non-coding nucleotide sequence, detection of metals, identification of metals, interactions within a gene or protein sequence, detection of metals, characterisation of antibody-antigen interactions, enzyme-substrate interactions and characterisation of ligand interactions. Multiplex applications include multiple pathogen diagnostics, multiplene genetic genotyping, clone and gene mapping, and gene expression analysis. The RTCs permit the ready detection of releasable mass labels by mass spectroscopy. The releasable mass labels permit the multiplexing of tens, hundreds and perhaps even thousands of different mass labels that can be used to uniquely identify each desired target.

Oligonucleotide separated by capillary affinity gel electrophoresis.

(first entry)

04-JUN-1998

process using capillary affinity gel electrophoresis. The invention relates to selective separation of electrophoresis. The invention of relates to selective separation of electrically charged target molecules in an analytical mixture. It comprises capillary affinity gel electrophoresis using a capillary tube which is at least partly filled with a polymer gel. Receptors for target molecules are covalently bound to the polymer. An electric field of at least 50 volts/cm is applied. The capillary tube is charged with the analytical mixture are bound to the receptors and the remaining components are eluted, optionally whilst splitting open. In a second stage, the elution conditions are changed, optionally in stages, so that the affinity of the target molecules for the receptor is eliminated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation and/or determination of charged organic compounds, and a second electramination of charged organic compounds, and a second electramination of charged organic compounds, and a second electramination of charged organic compounds. ö than prior art processes, especially in the case of complex biological analytical mixtures. It has high sensitivity, even with small amounts of samples. The derivatised polymers may be synthesised specifically using such as oligonucleotides, peptides or carbohydrates. It may be used, e.g. for isolation of specific proteins and DNA molecules, purification of antibodies, analysis of antisense compounds or screening for enzyme inhibitors. The process achieves higher resolution and selectivity Gaps Separation of electrically charged target molecules - by capillary affinity gel electrophoresis using polymer-gel to which receptors for target molecules are bound gel electrophoresis; separation; polymer-gel; ; 0 Length 15; Sequence 15 BP; 0 A; 0 C; 0 G; 15 T; 0 other; Example D3; Page 25; 41pp; English. This sequence represents an example of an oligonucleotide containing novel 3'-amino-5'-phosphoramidite nucleoside of the invention. The sequence is generated synthetically by using an amine-exchange reaction of phosphoramidites in which a deprotected 3'-amino group of an oligonucleotide chain is exchanged for the amino portion of a 5'-phosphoramidite with a protected 3' amino group. The resulting phosphoramidite internucleotide linkage is oxidised to form a stable
                                                                                                                                         /note= "contains internucleotide N3-P5 phosphoramidate internucleotide linkages"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents an oligonucleotide receptor molecule covalently bound to a polyacrylamide gel via a linking group. The invention relates to selective separation of electrically charged target molecules in an analytical mixture. It comprises capillary affinity gel electrophoresis using a capillary tube which is at least partly filled with a polymer of polymer. An electric field of at least 50 volts/cm is applied. The capillary tube is charged with the analytical mixture. In a first capillary tube is charged with the analytical mixture are bound to the capillary tube is charged with the analytical mixture are bound to the receptors and the remaining components are eluted, optionally whilst splitting open. In a second stage, the elution conditions are changed, optionally in stages, so that the affinity of the target molecules for the receptor is eliminated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for such as oligonucleotides, peptides or carbohydrates. It may be used, e.g. for isolation of specific proteins and DNA molecules, purification in thibitors. The process achieves higher resolution and selectivity than prior art processes, especially in the case of complex biological analytical mixtures. It has high sensitivity, even with small amounts of samples. The derivatised polymers may be synthesised specifically using standard methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0

The present primer was used to reverse transcribe human RNA, from which a cDNA sequence encoding a protein with heparanase catalytic activity was amplified. The heparanase (hap) polynuclectide is useful in gene therapy, particularly in treating tumour, inflammation or autoimmunity. Particularly, the polynuclectide is useful in modulating the bioavailability of heparin-binding growth factors, cellular responses to heparin-binding growth factors (e.g. bFGF) and cytokines (e.g. interleukin (IL)-8), cell interaction with plasma lipoproteins, cellular susceptibility to certain viral and some bacterial and protozoa infections, or disintegration of neurodegenerative plaques. The polynuclectide is also useful in wound healing (e.g. thermal, chemical or radiation burns), and in the treatment of angiogenesis, restenosis, arthroadclerosis, inflammation, neurodegenerative diseases (Gerstmann-Straussler Syndrome or Creutfieldt-Jakob disease), and some viral,
                                  New polynucleotides encoding a polypeptide having heparanase activity, useful in wound healing and in gene therapy, particularly in treating tumour, inflammation, autoimmunity, neurodegenerative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide #3 containing 3'-C-amino-5'(R)-C,3'-N-ethanothymidine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó
                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents an example of an oligonuclectide containing novel 3'-amino-5'-phosphoramidite nucleoside of the invention. The sequence is generated synthetically by using an amine-exchange reaction of phosphoramidites in which a deprotected 3'-amino group of an oligonucleotide chain is exchanged for the amino portion of a 5'-phosphoramidite with a protected 3' amino group. The resulting phosphoramidite internucleotide linkage is oxidised to form a stable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; heparanase; gene therapy; tumour; inflammation; autoimmunity; heparin-binding growth factor; cytokine; neurodegenerative plaque; wound healing; infection; burn; angiogenesis; restenosis; atherosclerosis; inflammation; neurodegenerative disease; Gerstmann-Straussler Syndrome; Creutzfeldt-Jakob disease; primer; ss

The present sequence is an oligonucleotide containing 3'-C-amino-5'(R)-C.3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3'.5'-bridged nucleosides which can be used as building blocks for oligonucleotides oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological stability. The conformationally-modified oligonucleotides may be useful as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide #2 containing 3'-C-amino-5'(S)-C,3'-N-ethanothymidine.
                                                                                                                                                                                                                                                                                                                               New conformationally restricted 3',5'-bridged nucleosides and oligonucleotides useful as antisense therapeutics or as gene-specific

All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides. Oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological stability. The conformationally-modified oligonucleotides may be useful as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide #4 containing 3'-C-amino-5'(R)-C,3'-N-ethanothymidine.
                                                                                                                                                                                                                                                                                                                                                                                                 New conformationally restricted 3',5'-bridged nucleosides and oligonucleotides useful as antisense therapeutics or as gene-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /*tag= a

PCR primers AAA46501-02 were used to amplify DNA encoding an endo-beta-mannanase enzyme, which is involved in the hydrolysis of polysaccharides that consist of molecules of mannan, either simple or branched, linked together by beta(1-4) bonds. The mannanase polynucleotide sequence is used for in vivo modification of the coffee endo-beta-mannanase gene. It is also used to produce transgenic plant cells (especially coffee cells) which have modified properties of mannan polysaccharide, and thus altered flavour or structure. The enzyme is used for modification, degradation or synthesis of mannan polysaccharide, and thus altered flavour or the increase the percentage of dry matter extraction, and thus reduce the quantity of sediment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  their pharmaceutically moderate salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleomonomer; cancer; gene regulation; antisense technology; leukemia; viral infection; inflammatory response; cellular proliferation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides modified nucleomonomers of specified formula and
pharmaceutical, cosmetic or food compositions to hydrolyze polymannans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is an oligonucleotide containing 3'-C-amino-5'(S)-C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in the sequence where incorporated by phosphoramidite chemistry using a DNA synchesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides. Oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological stability. The conformationally-modified oligonucleotides may be useful as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics.
                                                                                                                                                                                                                                                                                   New conformationally restricted 3',5'-bridged nucleosides and oligonucleotides useful as antisense therapeutics or as gene-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

inflammatory conditions, cardiovascular disorders, immune reactions, cancer, vival infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stablity when hybridizing to target mucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAAA07788-803 represent oligomucleotides forming a third strand along with the duplex sequences.
fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as

Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics Modified nucleomonomers, u oligomers used to inhibit

Disclosure; Page 20; 42pp; English

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regularion, cancer and virally-infected cells. They are used in oligomers for gene regularion, cancer and virally-infological samples such as those containing pathogenic bacteria, consistences, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth carcors and interleukins associated with pathological conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAAO7786 for details of other uses for which the oligomers are suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while AAAO 7793/C

non-toxic Modified nucleomonomers, used in physiologically stable, non-toxicoligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics

Disclosure; Page 20; 42pp; English.

their pharmaceutically acceptable sails. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antiense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAAO/786 for details of other uses for which the oligomers are suitable for).

Oligomers comprising the nucleomonomers exhibit increased duplex DNA reability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAAO/788-803 represent oligonucleotides forming a third strand along with the duplex sequences. invention provides modified nucleomonomers of specified formula and

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-inflored cells. They are used in oligomers for gene regulation, cancer acid molecules infected cells. They are used in oligomers for gene regulation, cancer and virally-inflored calls. They are used in oligomers for genes regulation, cancer and virally-inflored calls. They are used in oligomers and enzymes, to target sequences in biological samples such as those containing pathogenic bacteria, canced RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such a cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for).

Coligomers compressing the nucleomonomers exhibit increased duplex DNA catability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to panetrate into cells while mintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAA07788-803 represent oligonucleotides forming a third strand along with the duplex sequences.

Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics

Disclosure; Page 20; 42pp; English.

inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for).

Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as of stable association. Sequences AAA07788-803 represent oligonucleotides forming a third strand along with the duplex sequences.

The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, cancer and virally-infected cells. They are used in oligomers for gene regulation, cancer and virally-infected cells. They are used in oligomers for gene regulation, but and virally-infected cells sumples such as those containing pathogenic bacteria, genes or encoded RNAs that encode enzymes, normones, serum proteins, denesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as infections and bacterial infections (see AAAO7786 for details of other uses for which the oligomers are suitable for).

Coligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The uncleic acid sequences are highly mon-toxic and able to penetrate into cells while maintaining attingent saying the militant singel- or double-extranded target mucleic acid sequences. The coligomers demonstrate significant single- or double-extranded target mucleic acid sequences. The mucleic acid sequences or other forms. nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAA07788-803 represent oligonucleotides forming a third strand along with the duplex sequences.

invention provides modified nucleomonomers of specified formula and

Disclosure; Page 30; 42pp; English.

non-toxic

Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics

```
their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, artisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target to phological samples such as those containing pathogenic bacteria, adhesion molecules, receptor molecules, cortokines, oncogenes, growth hormones, asrum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth cfactors and interleukins associated with pathological conditions such as inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAAO7786 for details of other uses for which the oligomers are suitable for).

Coligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while colligomers demonstrate significant single- or double-stranded target conditions and blading activity to form duplexes, triplexes or other forms of stable association. Sequences AAAO7820-834 represent sequences forming

Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleid caid sequences, are tability when hybridizing to target nucleid caid sequences. An experimental parable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAAO7820-834 represent sequences forming cells such as bacterial, fungal, yeast, mammalian, cancer and virallyinfected cells. They are used in oligomers for gene regulation,
antisense technology, diagnostic applications to detect target sequences
in biological samples such as those containing pathogenic bacteria,
fungi and viruses, oncogenes, growth hormones and enzymes, to target
genes or encoded RNAs that encode enzymes, hormones, serum proteins,
adhesion molecules, receptor molecules, cytokines, oncogenes, growth
factors and interleukins associated with pathological conditions such as
inflammanchy conditions, cardiovascular disorders, immune reactions,
cancer, viral infections and bacterial infections (see AAAA07786 for
details of other uses for which the oligomers are suitable for). The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomoners are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in

Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics

Disclosure; Page 30; 42pp; English.

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virallycinfected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and erzymes, to target genes or encoded RNBs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAAO7786 for details of other uses for which the oligomers are suitable for).

Coligomers comprising the nucleomoners are suitable for) coligomers cancer, when hybridizing to target nucleic acid sequences, the the oligomers acid sequences. The coligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAAO7820-834 represent sequences forming triplex oligomers

                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence in the 3' non-core region. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and cneained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, and see used to combination with interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and

                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line.

The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepaticillar carcinoma. The ribozymes may be used in combination with interferent to treat HCV infection, other infectious diseases, autoimmune diseases, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·;

This invention relates to hybridisation probes which target a specific sequence within a large double-helical nucleic acid. The probe is complementary to the target sequence and contains at least one nucleotide with an attached molecule that is able to cleave double-helical DNA e.g. EDTA-Fe(II) (ethylenediaminetetraacetic acid-iron complex). The probes where the attached molecule is a label or compound that alters gene expression, are used for specific detection and/or cleavage of double-helical DNA, e.g. for diagnosis, for treatment of disease (particularly caused by viruses, genetic defects or oncogenes), for chromosomal naulayisis, and for the isolation and mapping of genes. The present sequence represents probe of the invention used in an example illustrating how the probe binds to and cleaves double stranded DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cross-linked vinyl acetate copolymer carrier material, AIDS treatment, phosphorothioate; solid phase synthesis; modified oligonucleotide; clinical diagnostic; cancer treatment; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This invention describes a novel chemical product comprising a partially hydrolysed cross-linked vinyl acetate copolymer carrier material loaded with nucleotide derivative(s). The product is an intermediate for the large (gram) scale solid phase synthesis of modified oligonucleotides useful e.g. as clinical diagnostics and therapeutics, e.g. for the treatment of AIDS and cancers. The presence of the partially hydrolysed copolymer facilitates the synthesis of larger amounts of oligonucleotides copolymer facilitates the synthesis of larger amounts of oligonucleotides compared with the use of Merckogel (RTM; macroporous polyvinyl acetate) described in Nucleic Acid Res. Sympos Ser. 31, p. 153, 1994.

Compared with the use of Merckogel (RTM; macroporous polyvinyl acetate) described in Nucleic Acid Res. Sympos Ser. 31, p. 153, 1994.

Compared with the use of described in very good quality and high yields, Also, the nucleosides do not display the reduced activity seen in some prior art procedures, less carrier material, reagents and solvent are required. Further, the carrier material, reagents and chus does not present disposal problems. It also swells uniformly in a range of solvents, which contraction during use or solvent exchange.

Compared AMIZOSIO-AMHZOSI3 represent oligonucleotides containing modified

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor IGF9]-1 receptor, IGF binding protein [IGF8P]-2 or IGF8P3), which is capable of infilammation or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scieroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia. Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell Gaps 0; Length 15; 1.4%; Score 15; DB 1; Length 15; 00.0%; Pred. The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticonse oligonuclectide, (for Insulin-like Growth Factor [GGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which can be useful for ameliorating the effects of APAF1513-F45161. The method is useful for ameliorating the effects of sociasis, ichthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the cetin, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating gastric acid disturbance by administering an oligonucleotide
                                                                                                                            Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gastric acid production inhibiting oligonucleotide SEQ ID NO: 90.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disturbance, gastric reflux, gastritis, dyspepsia, r, duodenal ulcer, Helicobacter pylori, antisense;

The present invention provides oligonucleotides, and methods for their use, which are useful in modulating the action of proteins involved in gastric acid production. The target protein is preferably the histamine H2 receptor or one of the proteins which form part of the gastric proton pump. The sequences and methods of the invention are useful in the treatment of gastric reflux, gastritis, dyspepsia, stomach ulcers, duodenal ulcers and other gastric acid disturbances, most of which are caused by Helicobacter pylori.
which modulates the activity of a polypeptide involved in gastric acid
                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of the oligonucleotide (ODN) component of an ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the invention. MGBs bind in a non-intercalating manner to the minor groove of non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly but in an intercalating manner, or lies in the minor groove, or is oriented in some other way to the DNA molecule by MGB, such that it becomes fluorescent (or its fluorescent properties because detectably). The conjugates are used as hybridisation probes and amplification primers for fluorescent detection of specifically hybridising sequences, for analysis or mismatch discrimination, target or signal amplification,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polyamide-oligonucleotide derivative, anticancer, antiproliferative, antiviral; hepatotropic; vasotropic; antisense inhibition; ribosyme; integrin; cell-cell adhesion; cancer; restenosis; stability; PNA; peptide mulleic acid; ss.
array-based assays and sequencing, including detection of double-stranded DNA by triplex formation. Many different targets can be detected a single reaction vessel. The present DNN-MGB-LF conjugate was used to demonstrate hybridisation-triggered fluorescence. Upon hybridisation to the complementary target sequence there was an increase in fluorescence yield, measured as the ratio of the fluorescence emitted by the hybrid between the ODN-MGB-LF conjugate and its target sequence to the fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF, of 8.3.
                                                                                                                                                                                                                                                                                    0;
                                                                                                                                                                                                                                           1.4%; Score 15; DB 1; Length 15; 100.0%; Pred. covatent linkage between LNA and PNA, it.e. a bond of a restue containing at least one atom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure containing at least one nucleobase different from thymine; and structure containing at least one nucleobase different from thymine; and crowdent bond. The products of the invention have anticancer, antiproliferative, antiviral, hepatotropic and vasotropic activity and can be used for the inhibition of gene expression by antisense, ribozyme, sense, or triple-helix methods, or by binding to proteins (aptamers). (1) are used for treating diseases caused by viruses (human immune deficiency, herpes simplex, influenza, vesicular stomatitis, hepatitis bor papilloma), or mediated by integrins or cell-cell adhesion reactions, for treating cancer, or for inhibiting restenosis, particularly as antisense reagents. They are solvinted in heterogeneous or homogeneous assays, as primers or probes, particularly where the target is amplified before being detected by the integrins or cell-cell adhesion reactions, for complementary strands and better stability in setting the increased affinity for complementary strands and better stability in setting the increased affinity for complementary strands and better stability in serum, associated with conventional peptide nucleic acids (PNA), but lack the disadvantages, i.e. have improved cellular better stability in materials, reduced cytotoxicity, better sequence specificity. They are more active than either DNA or PNA or PNA segments, allowing better discrimination between the pathogenic conditions such as the transition from the properties and non-pathogenic conditions such as the transition from proto-oncogene to oncogene, also, when used as primers, with the PNA component allows additional reactions not possible with the pNA allowing this enzyme to be used to eliminate the engages. Segment of such the PNA allowing this enzyme to be used to eliminate the he
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
covalent linkage between DNA and PNA, i.e. a bond or a residue containing

New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme.

Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV inflection in conjunction with one or more other drug therapies,

(MCSW/) (ROBE/) (PAVC/)

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme.

Construction The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme.

Construction The present did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma Macejack Pavco PA, Sequence 15 BP; 0 A; 0 C; 0 G; 15 U; 0 other; at seqdata.uspto.gov/psipsDIDEntry.html Roberts B, Claim 1; Page 64; 80pp; English.                                                         The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Bacherichia col; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a cukaryotic cell or by prokaryotic RNA polymerase; (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and polyadenylation region functional in the eukaryotic cell. The first of reaching with a same recombination site, and preferably are identical. The first and second recombination sites, or the third and fourth recombination sites, do not recombine with each other or with a same recombination site. The vector is useful for producing large amounts of double-stranded RNA which can be used for silencing large amounts of double-stranded RNA which can be used to convert a DNA fragment into an inverted repeat structure. Plants

C convert DNA fragment into an inverted repeat structure. Plants

C convert by breeding scheme to produce more plants with the same conventional breeding scheme to produce more plants with the same converteristics or to introduce a chimeric gene for reduction of the phenotypic expression of nucleic acids. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                               .;

                                                                                                                                                                                                                                                         The present invention relates to a method of detecting mutations in a mucleic acid by amplifying the mucleic acid to produce a double-stranded detection, in vitro transcription and translation of this amplicon, and detection of the translated protein. The primers used for amplifor, and are designed to produce an amplicon that is translatable and allows differentiation between translation products of wild-type and mutated mucleic acids. The method is used to detect mutations in tumour suppressor genes, for (early) diagnosis, monitoring and characterisation of tumours (especially of bladder and intestines) and in the garm line (using mucleic acids from embryos or blood cells). A new multi-tag vector is used to detected or verify the reading frame of a nucleic acid cloned in it, and to determine the suitability of detectable peptides for analysis and/or purification of a recombinant protein, expressed from a sequence cloned in the vector. The present sequence encodes a tag peptide and was
                                                        Detecting mutations in nucleic acid, useful for diagnosis and characterization of tumors, by amplification, in vitro transcription and translation, then protein detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Detecting mutations in nucleic acid, useful for diagnosis and characterization of tumors, by amplification, in vitro transcription and translation, then protein detection

Claim 11; Fig 5; 62pp; German.

The present invention relates to a method of detecting mutations in a nucleic acid by amplifying the nucleic acid to produce a double-stranded amplicon, in vitro transcription and translation of this amplifor, and detection of the translated protein. The primers used for amplification are designed to produce an amplicon that is translatable and allows differentiation between translation broducts of wild-type and mutated suppressor genes, for (early) diagnosis, monitoring and characterisation of tumours (especially of bladder and intestines) and in the germ line (using nucleic acids from embryos or blood cells). A new multi-tag vector is used to detect or verify the reading frame of a nucleic acid cloned in and to determine the suitability of detectable peptides for analysis and/or purification of a recombinant protein, expressed from a sequence in the vector. The present sequence encodes a tag peptide and was used in the invention. cloned

A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression -

Example 1; Fig 3B; 108pp; English.

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid

comprising first and second substantially complementary strands, and an oligonuclectide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonuclectide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression for requiatory sequences of a target gene. The oligonuclectides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonuclectides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic double-stranded DNA including specific originally bind to pathogenic double-stranded DNA including specific sequence can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The oligonuclectides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonuclectides are capable of forming triple-helices with such sequences in cancerous cells containing the calling or engressing the methods of the present expresents an oligonuclectide cancer invention.

                                                                                                                                                                                                                                                                                                                                                                                                                        셤
     The present invention relates to mentions and origonoriestication forming a triple-helix computating a double helical nucleic acid computating first and second substantially complementary strands, and an oligonuclectide bound to a purine-rich trarget sequence within the double helical nucleic acid, where the oligonuclectide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression is controlled by selective triple-helix formation within expression is regulatory sequences of arget gene. The oligonuclectical and the presence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonuclectides can be selected to specific appropriate pathogenic bacteria or viruses for replication or virulence, reducing their pathogenic bacteria or viruses for replication or virulence, reducing their pathogenic bacteria or viruses for replication or virulence, reducing their pathogenic bacteria or viruses for replication or virulence, reducing their pathogenic bacteria or viruses for replication or virulence, reducing their pathogenic bacteria or viruses for replication or virule oligonuclectides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonuclectides are capable of forming triple-helices with such sequences in cancerous cells containing the cancer causing cell. The present sequence repressing the cancer causing cell. The present sequence represents an oligonuclectide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABL57054/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
```

```
Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Windhab N;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                       The present sequence is of a trityl deprotected hydrazide phosphoramidite 15-mer, designated oligo 09, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and blosensor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /mod_base= "OTHER"

                          Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Windhab N;
                                                                                                                                                                                                                                                           Gaps
                                                                                 The present sequence is of a trityl deprotected hydrazide phosphoramidite 15-mer, designated oligo 031, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface blinding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         "4-((2-cyanoethyl)(diisopropylamino)
phosphanyloxymethyl)-benzoic acid methyl

                                                                                                            Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Windhab N;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "Diethyl 5-(((2-cyanoethoxy) (diisopropylamino)
   phosphanyloxy)methyl)isophthalate"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                 phosphoramidite 15-mer, designated oligo 033, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-wand peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding molecies, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                                                                                                                sequence is of a hydrazine treated hydrazide precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·.
                                                                                                                                         targets, contains phosphorous containing reactive group, hydra
protecting group and benzene ring, and has predefined formula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bruecher C,

```
Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /mod_base= "OTHER"
/note= "1,3-Bis-(3',5'-bis(ethyloxycarbonyl)
benzyloxy)-5-((2'-cyanoethyl)(diisopropylamino)
phosphanyloxymethyl)-benzene"
             Windhab N;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                             The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo 037, which was produced in process from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially MNA, macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo 034, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DMA, RNA, peptide mucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hydratidisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "1,3-Bis-(3',5'-bis(ethyloxycarbonyl)

targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula -
                                 Windhab N;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Windhab N;
                                                                                                                                                                                   The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo 035, which was produced in an example from the invention and which includes a synthetic branching amidite compound. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Diethyl 5-(((2-cyanoethoxy) (diisopropylamino)
phosphanyloxy)methyl)isophthalate, synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                   The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated cligo 039, which was produced in process for immobilisation of marcomolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of cligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation to surface binding moieties, or for other conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor
                                                                                                targets, contains phosphorous containing reactive group, hydrazide
protecting group and benzene ring, and has predefined formula
                                                                                                                                                                                                                                                                                                                                                                                                                         .;

targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                        in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, propriogy-RNA, proprides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in muleic acid hybridisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                 The present sequence is of an amino-C6-modified and Cy3 dye labeled T15 oligonucleotide that was used in a comparison of hydrazine and amine attachment moieties on active ester surfaces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;

This invention relates to oligonuclectide analogues comprising a protein nucleic acid molecule (PNA) monomer. They are used in the detection and separation of nucleic acid molecules and as probes, primers, linkers, adapters and antisense agents on solid supports. Modifications enhance their use as capture and detection probes e.g. by the incorporation of biotin, digoxiganen, radioisotopes, fluorescent labels such as fluorescein and reporter molecules such as alkaline phosphatase. They are also used for enhancing or inhibiting the activity of an enzyme or cellular activity. The compounds are stable to nucleases and proteases, have high affinity, binding specificity and solubility. The polyamide backbone of PNAs is resistant to both nucleases and proteases. PNAs bind nucleic acid molecules with greater affinity than DNA or RNA concentration. The compounds are relatively simple to synthesize and care used in a wide variety of applications. This sequence represents a DNA oligomer which is used to represent the effect of single base mismatches on oligonucleotides.
                                                                                                                                                                                                                                                                  ô
        secreted proteins in heterologus expression systems. The encoded polypeptides can be used to prevent tumour angiogenesis, metastasis and invasion, and to intervene with pathologies associated with impaired heparin-binding growth factors, cellular responses to heparin-binding growth factors and cytokines, cell interaction with plasma lipoproteins, cellular susceptibility to viral, protezoa and bacterial infections or disintegration of neurodegenerative plaques. The present sequence represents a chicken heparanase (hpa) cDNA cloning oligo dT(15) primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotides analogues useful in detection, separation and purification of nucleic acid molecules, comprise monomers, dimers and
                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleotide sequence of oligomer # 10 used to compare mismatches.
                                                                                                                                                                                                                                                                  .

The present invention relates to new human pre-adipose cell lines capable to differentiate to white adipose cells, exhibiting essentially the same cellular properties of normal white adipose cells. The human pre-adipose cell lines are useful for the identification of substances controlling the regulation of lipid uptake and release by human white adipocytes, and substances controlling the differentiation of preadipocytes into mature adipocytes. They are useful for screening compounds capable to regulate the secretion of any metabolites or hormones from human white adipocytes. Sequences of the invention are useful for developing drugs, food ingredients and supplements against obesity, diabetes and cardio-
                                                                                                                                                                                                                                                                                                                                                                                                                        Pre-adipose cell line; white adipocyte; food ingredient; obesity; lipid; diabetes; cardiovascular disease; reverse transcription; RT-PCR primer;

The present DNA sequence is a reverse transcription (RT)-FOR primer which is used for the expression of adipocytes in differentiated immortalised human preadipose cells. This primer is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                     Primer used for the expression of adipocytes in human preadipose cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human pre-adipose cell line capable of differentiating to adipose cells, useful in developing drug, food ingredients, and supplements against obesity, diabetes and cardiovascular diseases

The invention relates to derivatised antisense oligoribonucleotides with enhanced membrane permeability and stability. The derivatised antisense configurabionucleotide complementary to a sequence of uncleotides found in a virus or a cell is useful for inhibiting e.g., viral reverse transcriptase. Derivatised antisense oligoribonucleotide is conjugated at the 2'-O position with a hydrophobic carrier reagent containing a poly substituted phenyl compound. The derivatised oligoribonucleotides are used to decrease the expression of cancer cells which rely upon oncogene expression for their phenotypic and pathological properties. The oligoribonucleotides are used for increasing the effectiveness of antisense oligonucleotide are also used for increasing the effectiveness of antisense oligonucleotide cargetted to a gene associated with a disease or a condition in an animal. To alter gene transcription and/or translation for any gene or gene segment responsible for expression of leukaemia virus, hepatitis virus, oncogenes and human immunodeficiency virus. The present sequence is retroviral reverse transcriptase inhibitor DNP-poly [A] RNA fragment which is used in the treatment of moloney murine leukaemia virus (MuLV)
                                                                                                                                   RNase inhibitor; anti-HIV; cytostatic; hepatotropic; antiinflammatory; virucide; oncogene; cancer; transcription; translation; leukaemia virus; hepatitis virus; human immunodeficiency virus; retroviral; DNP-poly [A]; poly-2'-0-(2,4-dinitrophenyl)-poly [A]; viral reverse transcriptase; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Derivatized antisense oligoribonucleotide useful to inhibit e.g. viral reverse transcriptase comprises at the 2'-0 position of the oligoribonucleotide, a hydrophobic carrier reagent containing a poly substituted phenyl compound -
                                                                                               Retroviral reverse transcriptase inhibitor DNP-poly [A] RNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 15 BP; 15 A; 0 C; 0 G; 0 U; 0 other;

The present invention describes a method for cleaving single-stranded nucleic acid sequences at a desired location. Also described: (1) methods to displaying or expressing a member of a diverse family of peptides, collectively displaying at least a part of the diversety of the family, where the displaying at least a part of the diversity of the family, collectively displaying at least a part of the diversity of the family, an enchod for preparing single-stranded nucleic acids; (3) a method for preparing single-stranded nucleic genetic packages that display a member of a diverse family of peptides, polypeptides or proteins and that collectively display at least a portion of polypeptides or proteins and that collectively display at least a portion of the family; (4) a vector comprising a DNA sequence encoding an antibody variable region linked to a version of FILI anchor which does not mediate infection of phage particles, and wild-type gene III; (5) a method for producing a population or a library of immunoglobulin genes; and (6) a library of immunoglobulins that comprise members having at least one variable domain in which at least one of CDR1 and CDR2 contain synthetic diversity and CDR3 diversity is captured from B cells. The method is useful for cleaving single-stranded nucleic acid sequences at desired location, which can be subsequently used to produce libraries or genetic packages that display and/or express a diverse family of the present contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cleaving single-stranded nucleic acid sequences at a desired location by contacting the nucleic acid with an single strand oligonucleotide complementary to a nucleic acid region where cleavage is desired -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match 1.4%; Score 15; DB 1; Length 15; Best Local Similarity 100.0%; Pred. oligonuclectide. This provinces a macrime of protected coligonuclectide, which is preferably covalently attached to a solid support through a linkage, with a deprotection reagent comprising an active methylene compound and an amine reagent comprising an active methylene compound and an amine reagent comprising an active methylene compound and an amine reagent. The process and reagent minimise side-reactions leading to certain impurities that contaminate synthetic oligonuclectides. The present sequence is a T15 phosphoramidite oligonuclectide having a quencher moiety (Q) and minor groove binder (CPP13) at this protected oligonuclectide and man symphole of the invention. This protected oligonuclectide was treated either with 15% ethanolic ammonia for 2 hours at 55 degrees C. HPLC analysis showed that deprotection without DEM yielded a complex mixture of products containing only 26.5% of the desired product. When was used, 76.8% of the desired product was obtained. The present invention provides a method for deprotection of an

Identifying nucleic acid encoding novel sex-linked-tissue-linked receptors, useful for isolating odcrant binding proteins or pessicide alternatives, by analyzing sequences from a male- and female-specific nucleic acid library -

Disclosure; Fig 5; 83pp; English.

The present sequence is that of a poly-T oligonuclectide used in a method designed to rapidly array and normalize a complex cDNA library obtained from a target species. Clones are arrayed into multi-well plates. Each well contains 16 oligonuclectides with a 5' polylinker, a poly-T run capable of binding cDNAs by their poly-A tail and a unique 3' sequence, which allows an anchored oligonuclectide in each complementary 5' end. The unique 3' key sequences are designed to give a comprehensive level of degeneracy since they are diverse and numerous enough to ensure that every possible cDNA sequence can be bound by an individual, specific oligonuclectide in a single well. The CDNA library is heated to denature the clones into single stranded DNA, and an aliquot is added to every well. The anchored stranded DNA, and an aliquot is added to every well. The anchored cligonuclectide serves as the 3' primer in PCR, and the common 5' region present in every cDNA clone serves as the 5' priming site. Denaturing and washing leave anchored cDNA in each well. The library is now arrayed and normalised. The method was used to identify and cisolate clones encoding G-protein coupled receptors, especially colourant receptors, and active effectors involved in the olfactory proteins, or other olfactory or neuronal proteins. The identified reduce a target animal's sensitivity to odours, for manifacturing compounds or devices that mask odours, or trapping invertebrates with codourants. Semicochemicals (e.g. arometics or pheromone mimetics) can be developed with desirable effects on specific species, for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X) mS' - (alpha)n-beta-N3', or (X)mS' - (gammal-k-deltea-N3', where

X = a labelled compound and/or a nucleotide with voluntary sequence;

m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, gamma = thymine or cytosine;

N = adenine, guanine or tytosine or thymine; gamma = thymine;

K = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.
pathway of invertebrates and vertebrates, e.g. odourant binding proteins, or other olfactory or neuronal proteins. The identified receptors and proteins are useful for identifying compounds that reduce a target animal's sensitivity to odours, for manufacturing compounds or devices that mask odours, or trapping invertebrates with odourants. Semicohemicals (e.g. arometics or pheromone mimetics) can be developed with desirable effects on specific species, for the development of pest monitoring systems or non-toxic, species-specific pesticide alternatives, for controlling insect feeding and breeding behaviour, detecting the presence of small air-borne molecules, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.
                                                                                                                                                                                                                                                                                         Gaps

```

```
This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X) m5 - (alpha)n-beta-N3', or (X)m5' - (gamma)k-delta-N3'; where

X = a labelled compound and/or a nucleotide with voluntary sequence;

m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine;

N = adenine, guanine, cytosine or thymine; gamma = thymine;

k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guannine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for
                                                                                                                                                                              RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme, hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human flt1 VEGF receptor hammerhead ribozyme substrate #1097.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1.4%; Score 15; DB 1; Length 17; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of a perfectly matched target sequence for a molecular beacon comprising an oligonucleotide probe (see ABL57069) covalently attached at the 3' end to fluorescent dye and at the 5' end to a nanoparticle. In the native state, the proximity of the fluorence and quencher (gold nanoparticle) in the molecular beacon results in little or no detectable fluorescence. Upon hybridisation of the central complementary stretch of the probe to a target sequence, such as the present sequence, the hairpin undergoes a conformational change resulting in an increase in fluorescence, the extent of which is proportional to the amount of target sequence present. Single mismatches can be detected. The invention relates generally to the use of metal curface quenchers such as particles or films for high sensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           flk-1, KDR; hammerhead ribozyme; hairpin ribozyme; cleavage;

PCR primers AAV37933-39 are used in the course of the invention. The specification descibes a novel protein isolated from leukocytes of patients with IgA nephropathy. Oligonucleotides based on the DNA sequence encoding this protein are useful as reagents for diagnosing Example 2; Page 33; 41pp; Japanese.

; 0 The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGP). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid archritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention. Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient Gaps 0; 1.4%; Score 15; DB 1; Length 17; 100.0%; Pred. and DNA encoding it - useful as reagents for IgA nephropathy Protein from leukocytes diagnosing and treating

This oligo(T) synthetic oligonucleotide was used for first strand cDNA synthesis from total RNA isolated from either logarithmically growing or quiescent 10T1/2 mouse fibroblast cells. It was also used with an arbitarary d(N10) primer in PCR. The PCR products were used in a differential display to identify the mSARP1 gene (see AAV19112) that codes for novel murine secreted apoposis related polynucleotides (see also ANW37814). The invention relates to SARP polynucleotides (see also ANW37815-17), antibodies specific for SARP, and use of such polynucleotides and antibodies in diagnostic and therapeutic methods, and methods for treating diseases related to the regulation of SARP expression in tissue and body fluid samples, New secreted apoptosis-related proteins - useful for modulating apoptosis, particularly for treatment of prostatic or breast cancer, also for diagnosis and monitoring of disease Secreted apoptosis-related protein; SARP; mSARD1; mouse; prostate cancer; breast cancer; diagnosis; gene therapy; PCR; 1.4%; Score 15; DB 1; Length 17; 100.0%; Pred. ```

The invention relates to the human pollinosis-associated gene 581 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgB (immunoglobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates also relates to the protein encoded by pollinosis-associated gene 581; to expression constructs and host cells comprising pollinosis-associated gene 581 primers and probes; outleic acids; pollinosis-associated gene 581 primers and probes; anticleic acids pollinosis-associated gene 581 primers and probes; of pollinosis-associated gene 581 mucleic acids; plinosis-associated gene 581 primers and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 581 mucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 581 in pollen and anticle of a cells in the presence of a test compound relative treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 581 cDNA. to a control.Pollinosis-associated gene 581 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR prime

Pollenosis-associated gene 581 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates

The invention relates to the human pollinosis-associated gene 513 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific 19E (immunoglobhlin E) levels. The gene with high cedar pollen-specific 19E (immunoglobhlin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen can be detection of pollinosis-associated gene 513 nucleic acids; a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 513 nucleic acids; and methods of screening drug candidates for the treatment of allergic diseases by measuring the expression of pollinosis-associated gene 513 in pollen antigen-stimulated companies of a test compound relative to a control.

T-cells in the presence of a test compound relative to a control.

Pollinosis-associated gene 513 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer control.

Control of the present sequence represents a PCR primer control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pollinosis-associated gene 513 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates
                                                                                                                                                                                                                                                                                                                                                                                          ŝ

PCR anchor primer, SEQ ID NO:4, used in human gene 513 isolation.

Human, pollinosis-associated gene 513; IgE; immunoglobulin E; cedar pollen allergy; T-cell; reduced expression; detection; diagnosis; drug screening; allergic disease; PCR primer; ss.

WO200065049-A1.

```
The invention relates to the human pollinosis-associated gene 513 which withhits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IGE (immunoslobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen consists of detection of pollinosis-associated gene 513 mucleic acids, a method of diagnosis of allergic diseases via the detection of pollinosis associated gene 513 mucleic acids, and methods of screening cut method of pollinosis associated gene 513 in ucleic acids, and methods of screening consists of allergic disease by measuring the caturage for the treatment of allergic disease by measuring the caturage and in the presence of a test compound relative to a control.

Collinosis-associated gene 513 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 513 cDNA.
                                                                                                                                                                                                                                                                                               Pollinosie-associated gene 513 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates

The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from Individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 419 has common the gene encoding human Fas-associated gene 419 has been encoding human Fas-associated gene 419 primers of the invention also relates to the protein encoded by pollinosis gene associated gene 419 protein encoded by pollinosis gene associated gene 419 protein encoded by the gene; methods and probes; antibodies against the protein encoded by the gene; methods of diagnosis of allergic diseases via the detection of pollinosis-associated gene 419 nucleic acids; pollinosis-associated gene 419 protein encoded by the gene; methods of diagnosis of allergic diseases via the detection of pollinosis-associated gene 419 in cleic acids. The invention additionally encompasses of methods of screening drug candidates for the treatment of allergic companies of pollinosis-associated gene 419 in the creatment of allergic companies of classes of allergic diseases and in the presence of a test compound diagnosis of allergic diseases and in the presence of a test compound for the treatment of allergic diseases and in the presence of a test compound for the treatment of such and incomparent encoded gene 419 is useful in the presence of a treatment of allergic diseases and in the presence of a treatment of allergic companies of allergic diseases and in the presence of a treatment of allergic for the treatment of annex and in the presence of a treatment of allergic companies of allergic diseases and in the presence of a treatment of allergic companies of allergic diseases and in the presence of a treatment of allergic companies of allergic diseases and in the presence of a treatment of allergic companies of allergic co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;
                                                                                                                                          Pollinosis-associated gene 419 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene
                               Obayashi M, Gunji S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR anchor primer, SEQ ID NO:4, used in human gene 419 isolation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; pollinosis-associated gene 419; FAF-1 homologue;

The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar collent appecific 1gE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 419 has common also relates to the protein encoded by pollinosis gene common also relates to the protein encoded by pollinosis gene associated gene 419 nucleic acids; pollinosis-associated gene 419 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene; methods of diagnosis of allergic diseases via the detection of pollinosis-associated gene 419 nucleic acids; pollinosis-associated gene 419 nucleic acids. The invention additionally encompasses of methods of screening drug candidates for the treatment of allergic diseases by measuring the expression of pollinosis-associated gene 419 in the control. Pollinosis-associated gene 419 in the treatment of such diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents
                                                              Pollinosis-associated gene 419 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR anchor primer, SEQ ID NO:4, used in human gene 373 isolation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·

Pollinosis-associated gene 373 undergoing significantly low expression in subjects with high cedar pollen-specific immunoglobulin-E levels, useful in diagnosis of allergic diseases and screening drug candidates

Example 6; Page 70; 80pp; Japanese.

The invention relates to the human pollinosis-associated gene 373 which with high cedar poller specific Igs (immunoglobulin B) levels. The gene wath high cedar poller specific Igs (immunoglobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen relates to the protein encoded by pollinosis gene 373; expression constructs and host cells comprising pollinosis-associated gene 373 nucleic acids; pollinosis-associated gene 373 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 373 mucleic acids; pollinosis-associated gene 373 mucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 373 mucleic acids; and a method of gene 373 nucleic acids. The invention additionally encompasses methods of gene 373 nucleic acids. The invention additionally encompasses methods of 20 screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 373 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 373 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 373 cDNA.

Pollinosis-associated gene 373 undergoing significantly low expression in subjects with high cedar pollen-specific immunoglobulin-E levels, useful in diagnosis of allergic diseases and screening drug candidates

The invention relates to the human pollinosis-associated gene 373 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IGE (immunoglobulin E) levels. The gene CC was isolated from T-cells from individuals allergic to cedar pollen constructs and by the protein encoded by pollinosis gene 373; expression constructs and host cells comprising pollinosis-associated gene 373 constructs and host cells comprising pollinosis-associated gene 373 primers and probes; constructs and host cells comprising pollinosis-associated gene 373 primers and probes; contibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 373 mucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of pollinosis-associated gene 373 mucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic diseases by measuring the expression of pollinosis-associated gene 373 in pollen anigen-stimulated T-cells in the presence of a test compound relative to anigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 373 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the creatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 373 cDNA. Example 6; Page 70; 80pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel DNA sequences preferentially expressed in IgA nephropathy patients, and DNA sequences stringently hybridizing to labem. Independent claims cover diagnostic reagents for IgA nephropathy incorporating the antisense sequences; the treatment of IgA nephropathy using the antisense sequences; the production of the proteins associated with IgA nephropathy, containing sequences encoded by the DNA sequences; by culture of host cells transformed with DNA encoding them; diagnostic reagents for IgA nephropathy which contain the antibodies; and compositions for the treatment of IgA nephropathy which contain the antibodies. The products of the invention can be used for the diagnosis and treatment of IgA nephropathy may a primer used in the isolation and identification of the human IgA nephropathy associated proteins

This sequence represents a PCR primer used in the identification of a human pollenosis associated gene. The gene is highly expressed in individuals with high pollen-specific immungalobilin E (IgB) levels. The invention relates to the nucleotide sequence encoding the pollenosis associated protein, diagnosing pollenosis and screening candidate compounds for treating pollenosis. The gene can be used in diagnosing pollenosis, particularly cedar pollenosis, and screening candidate compounds for pollenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gunji S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel DNA sequences preferentially expressed in 19A nephropathy patients, and DNA sequences stringently hybridizing to them. Independent claims cover diagnostic reagents for 19A nephropathy incorporating the antisense sequences; the treatment of 19A nephropathy using the antisense sequences for mRNA inhibition; proteins associated with 19A nephropathy, containing sequences encoded by the DNA sequences; antibodies recognizing these proteins; the production of the proteins by culture of host cells transformed with DNA encoding them, diagnossic reagents for 19A nephropathy containing the antibodies; and compositions for the treatment of 19A nephropathy which contain the antibodies. The products of the invention can be used for the diagnosis and treatment of 19A nephropathy. This sequence represents a primer used in the isolation described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0

This sequence represents a PCR primer used in the identification of a human pollenosis associated gene. The gene is highly expressed in individuals with high pollen-specific immunoglobulin E (IgE) levels. The invention relates to the nucleotide sequence encoding the pollenosis associated protein, diagnosing pollenosis and screening candidate compounds for treating pollenosis. The gene can be used in diagnosing pollenosis, particularly cedar pollenosis, and screening candidate compounds for pollenosis treatment.
                                                                                         Gene highly expressed in patients with high cedar pollen-specific IgE levels, useful for diagnosing pollenosis, and screening candidate compounds for pollenosis treatment
                                                                                                                                                                                                                                                                                                Example 6; Page 38; 44pp; Japanese.

optionally cleave, target nucleic acids that interact, and sequences, used to treat cancer New

Claim 77; Page 79; 148pp; English.

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting

treated cells, or for other conditions associated with levels of osstrogen receptor. Because of the high selectivity for targeted RNA, (A) alterations he used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that targets, and as research reagents (for RNA, in the same way that modification endonucleases are used with DNA). The combination of harmories in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA24748 to AAA25992 represent their corresponding target sequences. AAA26107 to AAAA26218 represent their corresponding target sequences. AAA26107 to AAAA6218 represent their corresponding target sequences. AAA26107 to AAAA6212 represent their corresponding target sequences. AAA26219 to AAAA6217 represent corresponding target sequences. AAA26219 to AAAA6271 represent corresponding target sequences and antisense oligonucleotides used in the exemplification of the present invention.

Measuring expression of low abundance reduced complexity target nucleic acid molecules -

Example 3; Page 91; 187pp; English.

AAZ36739-41 represent oligo(dT) primers used for modified differential display, in the method of the invention. The specification describes a method for measuring the level of two or more nucleic acid molecules in a target. The method comprises contacting a probe with an axbitrarily or statistically sampled target and detecting the amount of specific binding of the target to the probe. The methods can be used to identify differentially expressed nucleic acid molecules associated with disease

states, such as cancer, autoimmune disease, infectious disease, aging, developmental disorder, proliferative disorder or neurological disorder. Alternatively the methods can be used to assess the efficacy or toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in response to a stimulus, e.g. a chemical, drug or growth factor (especially can also be used to determine co-regulated some pathogen. The methods can also be used to determine co-regulated genes that can be potential targets for drug discovery.

Preparation of nucleic acid sample, useful for analysis of rare expressed genes

Disclosure; Page 11; 22pp; English.

The present invention describes a process for the preparation of a nucleic acid sample comprising: (a) providing a nucleic acid sample comprising: (a) providing a nucleic acid sample or nucleic acid sample or plurality of kinds of probes having a known sequence substantially complementary to a portion of sequence of the nucleic acid sample; (b) mixing and hybridizing the nucleic acid sample with probes; (c) subsequently recovering nucleic acid sample with probes; (c) nucleic acid sample having a plurality of species of sequences, and providing one or a plurality of kinds of probes having a known sequence or substantially complementary to a portion of sequence of the nucleic acid sample; (ii) mixing and hybridizing the nucleic acid sample with the probes; (iii) treating the product of (ii) with nuclease activity of an enzyme or the probe itself; and (iv) subsequently recovering the nucleic acid molecules not digested by the nuclease activity in (iii), or (I) providing a nucleic acid sample having a plurality of species of sequences and oligonucleorides primer having predetermined sequences for synthesizing DNA strands; (II) providing one or a plurality of kinds of

probes having a known sequence substantially complementary to a portion of a sequence of the nucleic acid sample having such a structure to prevent a polymerase reaction from its 3' end and a nuclease reaction from its 5' end; (III) mixing and hybridizing the nucleic acid sample with the primers and probes; (IV) executing polymerase chain reaction with the primers and probes; (IV) executing polymerase chain reaction nucleic acid molecules synthesized in (IV). The method is useful for the preparation of a nucleic acid sample for the analysis of rare expressed exemplification of the present invention. 8888888888888888

The invention relates to the human pollinosis-associated gene 787 which exhibits significantly reduced expression in the T-cells of individuals after the pollen-scattering season, relative to expression levels in T-cells before the pollen-scattering season. The gene was isolated from T-cells from individuals allergic to pollen using the differential display method. The invention also relates to pollinosis-associated gene 787 primers and probes; method of detection of pollinosis-associated gene 787 primers and probes; method of detection of pollinosis-associated control additionally encompasses a method of fargening frug candidates in the treatment of allergic disease by measuring the expression of pollinosis-associated gene 787 in pollen antigen-stimulated T-cells in the screening of drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 787 in pollen antigen-stimulated T-cells in associated gene 787 in pollen antigen-stimulated facels in the screening of drug candidates for the treatment of such diseases and in the screening of expression of the present sequence represents a PCR primer used in the isolation of the treatment of such diseases. human pollinosis-associated gene 787 cDNA. Example 6; Page 40; 54pp; Japanese.

The present invention describes the human pollinosis-associated gene 465 which has a nucleic acid sequence of 3442 base pairs (bp), given in (AAC92291), that undergoes significantly low expression in subjects after pollen scattering, and is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The present sequence respensents a PCR primer which is used in an example from the present invention.
                                                                                                                                                                                             Pollinosis-associated gene 465 undergoing significantly low expression in subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of T cells to antigen stimulus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pollinosis-associated gene 465 undergoing significantly low expression in subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of T cells to antigen stimulus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     d
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the human pollinosis-associated gene 787 which exhibits significantly reduced expression in the T-cells of individuals after the pollen-scattering season, relative to expression levels in T-cells before the pollen-scattering season. The gene was isolated from T-cells from individuals allergic to pollen using the differential display method. The invention also relates to pollinosis-associated gene 787 primers and probes; methods of detection of pollinosis-associated gene 787 nucleic acids, method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 787 nucleic acids. The invention additionally encompasses a method of screening drug candidates in the treatment of allergic diseases by measuring the expression of pollinosis-associated gene 787 in pollen antigen-stimulated T-cells in associated gene 787 in pollen antigen-stimulated T-cells in associated gene 787 in pollen attigen stimulated T-cells in associated gene 787 in upollen the treatment of such diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 787 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..

The present invention describes the human pollinosis-associated gene 465 which has a nucleic acid sequence of 3442 base pairs (bp), given in 4AC92291), that undergoes significantly low expression in subjects after pollen scattering, and its useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The present sequence represents a PCR primer which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          B1001; B1466; B1072; B1151; T-cell; allergy; atopic dermatitis; human; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosis of allergies including atopic dermatitis

The invention provides a method of diagnosis of allergies that involves: assaying the levels of expression of genes B1001, B1466, B1072 or B1151 in T-cells, and comparing them with the level of expression in healthy T-cells. The method is useful for diagnosing allergies, particularly atopic dermatitis. The present sequence represents a PCR primer used for analysis of the expression of the above genes.
                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides a method of diagnosis of allergies that involves: assaying the levels of expression of genes B1001, B1466, B1072 or B1151 in T-cells; and comparing them with the level of expression in healthy T-cells. The method is useful for diagnosing allergies, particularly atopic dermatitis. The present sequence represents a PCR primer used for analysis of the expression of the above genes.

The present invention relates to a method for examining allergic diseases with intersectin 2 as an indicator gene, which comprises determining the expression level of the gene in the eosinophils in a patient, and comparing the expression level with that in the eosinophils of a healthy individual. The method is also examining allergic diseases, particularly atopic dermatitis, which is also applicable in screening candidate compounds for remedies. The present sequence is an anchor primer described in the exemplification
                                             The present invention relates to a method of examining allergic diseases which comprises comparing the expression level of gene B1153 in allergy patients with the expression level in healthy subjects. The method is useful for the treatment, prevention, diagnosis and study of allergic diseases including atopic skin inflammation and asthma. The present sequence is a PCR primer described in the exemplification of the

The method is useful for the treatment, prevention, diagnosis and study of allergic diseases including atopic skin inflammation and asthma. The present sequence is a PGR primer described in the exemplification of the

Examining allergosis, involves measuring the expression levels of a specific gene, and comparing it to the levels in the eosinophils of healthy control -
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the eosinophils of a healthy person. The method is used for the examination of allergosis. The present sequence represents a PCR primer, which is used in the course of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for examining allergic diseases with intersectin 2 gene or a gene with equivalent function of intersectin 2 as an indicator gene, which comprises determining the expression level of the gene in the cosinophils in a patient, and comparing the expression level with that in the cosinophils of a healthy individual. The method is for examining allergic diseases, particularly adoptic dermatitis, which is also applicable in screening candidate compounds for remedies. The present sequence is an anchor primer described in the exemplification
                                                                                                                                                                                                                                                               Allergic disease examination method related anchor primer SEQ ID NO: 4.

which involves determining the expression level of a gene, having one of the 17 nucleotide sequences shown in ABN99812-ABN99828, in the eosinophils in a patient and comparing the expression level with that in the eosinophils of a healthy individual. The method can be used to examine allergic diseases, particularly atopic dermatitis, and its early diagnosis, which is also applicable in screening candidate compounds for remedies. The present sequence is a PCR primer described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Method for examining allergic diseases by differential display of seventeen genes showing different expression particularly significant increase in eosinophils in patients with mild atopic dermatitis, also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for examining allergic diseases which involves determining the expression level of a gene, having one of the 17 nucleotide sequences shown in ABN99912-ABN99228, in the eosinophils in a patient and comparing the expression level with that in the eosinophils of a healthy individual. The method can be used to examine allergic diseases, particularly atopic dermatitis, and its early diagnosis, which is also applicable in screening candidate compounds for exemplification of the invention.
       and comparing it to the levels in the eosinophils of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Method for examining allergic diseases by differential display of seventeen genes showing different expression particularly significant increase in eosinophils in patients with mild atopic dermatitis, also
                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                            The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the ecsinophiis of a healthy person. The method is used for the examination of allergosis. The present sequence represents a PCR primer, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; allergy; atopic dermatitis; eosinophil; anti-allergic; PCR;

Examining allergic diseases by differential display of gene showing different expression particularly increased expression in remission stage in eosinophils of patients, also applicable in screening

Example 1; Page 57; 72pp; Japanese.

candidate compounds for remedies

```
The invention relates to a method for examining allergic diseases comprises determining the expression level of a gene containing, the human colbn appearing as ABK49633 which has bownlooy with acetyltransferases in the eosinophils of a patient and comparing the expression level with that in the eosinophils of a healthy individual (i.e. differential display). Also included are methods of screening for candidate compounds which affect the expression level of the gene or the activity of the protein encoded by the gene (including related proteins and mutants), the use of probes based on the gene sequence in the examination of allergic diseases, the use of reporter constructs in the screening of candidate compounds, a vector containing a tentral constructs in the screening of candidate compounds, a vector containing the transcription-controlling respon of the gene, cells transformed with the vector, an antibody against the protein and a model animal for lowering of expression intensity of the gene in eosinophils. The method is examining allergic diseases particularly atopic dermatitis which is also applicable in screening candidate compounds for remedies. Such method can be performed in high throughput, at low cost. The present sequence is a differential display PCR primer.

The invention relates to a method for examining allergic diseases comprises determining the expression level of a gene containing, the human colva appearing as ABK49633 which has homology with a cetyltransferases in the eosinophils of a patient and comparing the axpression level with that in the eosinophils of a healthy individual (i.e. differential display). Also included are methods of screening for candidate compounds which affect the expression level of the gene or the activity of the protein encoded by the gene (including related proteins and mutants), the use of probes based on the gene sequence in the examination of allergic diseases, the use of reporter constructs in the sureening of candidate compounds, a vector containing a the transcription-controlling region of the gene, cells transformed with the vector, an antibody against the protein and a model animal for lowering of expression intensity of the gene in eosinophils. The method is examining allergic diseases particularly atopic dermatities which is also applicable in screening candidate compounds for remedies. Such method can be performed in high throughput, at low cost. The present sequence is a differential display PCR primer compounds to the present sequence is a differential display PCR primer compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to gene sequences that are differentially expressed in eosinophils from patients with atopic dermatitis in the increment stage as compared with those in the remission stage. These sequences are used in a novel method for examining allergic diseases comparing the expression levels of these genes and comparing the expression level with that in the eosinophils of a healthy individual. The method of the invention may have antiallergic of dermatological activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also allergic diseases particularly atopic dermatitis, and may also invention can be performed in high throughput, at low cost. The present sequence represents the GTISC PCR primer used to amplify the differentially amplified atopic dermatitis related cDNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                      Examining allergic diseases by differential display of genes showing different expression particularly increase in remission stage in

comprising determining the expression levels of these genes and comparing the expression level with that in the eosinophils of a healthy individual. The method of the invention may have antiallergic or dermatological activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also be used to screen candidate compounds for remedies. The method of the invention can be performed in high throughput, at low cost. The present sequence represents the GTISG PCR primer used to amplify the differentially amplified atopic dermatitis related cDNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        POMPOUS;
                                                                                                                                                                                                                                               This invention relates to gene sequences that are differentially expressed in eosinophils from patients with atopic dermatitis in the increment stage as compared with those in the remission stage. These sequences are used in a novel method for examining allergic diseases

                                                                                                                                                                                   repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic repeats in marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABN79676-ABX80022 are the polymorphic repeats identified for a search of human BSTS.
                                                                                                                                                                 The invention discloses a method for identifying a candidate polymorphic
                                 Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases.

                                                                                                                                                                                                                                                                                                                of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases.

The fusion gene is inserted into a region of a vaccinia virus not essential to its propagation, to give a recombinant Hela, vero, VEF, rabbit kidney RK13 or human myeloma TK-143 cells). Upon culturing the host cell produces particulate structures containing the fusion gag protein. The recombinant vaccinia virus or the fusion gag protein particles may be used in the production of vaccines for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hypervariable region; ENV protein; vaccinia virus; gag gene; retrovirus; vaccines; infection; protection; primer; ss.
                                                                                                    This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases.
                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                 .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant vaccinia virus containing fusion HIB gag gene - for production in host cells of gag protein for use as vaccine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to functionalised nanocrystals for use in nonisotopic detection systems for biomolecules e.g. nucleic acids, proteins, lipids or drugs. The nanocrystals have polynucleotide strands attached to their surfaces with one end of the polynucleotide extending outwardly from the nanocrystal. The present sequence is one such polynucleotide. These nanocrystals are used with a second series of manocrystals, which have polynucleotides complementary to the first polynucleotides, so that the respective complementary to the first polynucleotides, so that the respective complementary strands hybridise to each other and form a dendrimer. This dendrimer produces a signal which can then be detected e.g. fluorescence. The present sequence is composed mainly of Adenine bases. This sequence may therefore be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Functionalized nanocrystal carrying polynucleotide, used for detecting target analyte, forms dendrimers with complementary nanocrystals to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   used with a polynucleotide composed mainly of Thymine bases (AAA58386)

nonfotopic detection systems for biomolecules e.g. nucleic acids, proteins, lipids or drugs. The nanocrystals have polynucleotide strands attached to their surfaces with one end of the polynucleotide extending outwardly from the nanocrystal. The present sequence is one such polynucleotide. These nanocrystals are used with a second series of manocrystals, which have polynucleotides complementary to the first to each other and form a dendrimer. This dendrimer produces a signal which can then be detected e.g. fluorescence. The present sequence is composed mainly of Thymine bases. This sequence may therefore be used with a polynucleotide composed mainly of Adanine bases (AAAS8385).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to functionalised nanocrystals for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Functionalized nanocrystal carrying polynucleotide, used for detecting target analyte, forms dendrimers with complementary nanocrystals to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Adipose tissue, obesity, diabetes, hyperlipemia, hypertension, human, arteriosclerosis, hyperuricemia, sleep apnea syndrome, PCR primer, ss.
